1.1 Installation of core tools

If you are used to working with python, conda virtual environments and GitHub, skip this part and use your usual tools.

Step 1: Download and install python

Get the latest version (minimum Python 3) from the official website: [Download Python | Python.org](https://www.python.org/downloads/), and follow the instructions.

Windows	macOS	Linux (Ubuntu/Debian)
Python Releases for Windows Python.org Download install manager Check “Add Python to PATH”	Python Releases for macOS Python.org	Python Source Releases Python.org How to Install Python on Linux - GeeksforGeeks

Step 2: Install Git

From the official website: [Git](https://git-scm.com/), and follow the instructions.

Windows	macOS	Linux (Ubuntu/Debian)
Git - Install for Windows Keep all default options	Git - Install for macOS	Git - Install for Linux

Step 3: Install anaconda navigator

From the official software: [Installing Navigator - Anaconda](https://anaconda.com/anaconda-navigator/), and follow the instructions.

Step 4: Install Visual Studio code and its python extension

From the official website: [Download Visual Studio Code - Mac, Linux, Windows](https://code.visualstudio.com/download)

For Microsoft users only, install the python extension: open VS Code and follow instructions

1.2 Basic commands

Accessing a folder on a terminal

To open a terminal, open the search bar, type in “terminal”, and open it (see below for Windows).

Then type in the command `cd` and then your folder absolute path

STEP 1: type in "terminal" in the search bar

STEP 2: open the terminal

STEP 3: what you see when you open the terminal

STEP 4: copy the path to your working directory

STEP 5: back to the terminal, type in "cd " and paste the path from STEP 4, press enter
You are now within your working directory

```
PS C:\Users\lecrivau> cd C:\Users\lecrivau\source\repos\HaDy-toolbox
PS C:\Users\lecrivau\source\repos\HaDy-toolbox> |
```
